

LogGraph

Display Measurement Results

LogGraph is a convenient utility for displaying, organising and efficiently assessing recorded measurement data. This tool makes it easy to correlate measurement data, signals, positions and audio-visual descriptions. It is typically used to evaluate signals for vehicle speed, engine speed, and the vehicle electrical system voltage.

- › Display of arbitrary signals as graph (e.g. speed)
- › Adjustment of the graphical style of the data display
- › Setting of the scales of time and values for each signal
- › Measuring of the value and the time at a specific point
- › Creation of a report on the basis of the log file and the printing of the report
